                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                   The invention relates to a transgenic plant cell (I) transformed by a phosphatase stress-related protein (PHSRP) coding nucleic acid (ABN81330-ABN81334), where expression of the nucleic acid in the plant cell results in increased tolerance to an environmental stress as compared to a wild type variety of the plant cell. PHSRP encoding genes are useful for identifying Physcomitrella patens and related organisms, as markers for specific regions of the genome, mapping of genomes of organisms related to P. patens, identification and localisation of P. patens sequences of interest, evolutionary studies, determination of PHSRP regions required for function, modulation of a PHSRP activity, modulation of the metabolism of one or more cell functions, modulation of stress resistance. The gene is also useful for identifying and/or cloning PHSRP homologues in other cell types and organisms, for identifying an organism as being PHSRP studies. The present sequence is that of a PHSRP encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   250

The invention relates to a transgenic plant cell transformed by a phosphatase Stress-Related Protein (PHSRP) coding nucleic acid. The expression of the nucleic acid in the plant cell results in increased tolerance to an environmental stress (e.g. salt tolerance, cold and drought) as compared to a wild type variety of the plant cell. Also include are a transgenic plant comprising the novel plant cell. Also produced by the transgenic plant comprising the novel plant cell, a seed produced by the transgenic plant of (where the seed is true breeding for an increased tolerance to environmental stress as compared to a wild type variety of the plant cell, an agricultural product produced by the plant or seed, an isolated PHSRP or PHSRP coding nucleic acid, and producing a transgenic plant of plant containing PHSRP nucleic acid. The transgenic plant cell transformed by a Phosphatase Stress-Related Protein (PHSRP) coding nucleic acid is useful for modifying stress tolerance of a plant. The present sequence encodes the PHSRP, protein phosphatase, PP2A-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GlyAspTyrValAspArgGlyTyrTyrSerValGluThrValSerLeuLeuValAlaLeu 100

The invention describes a recombinant DNA construct compris:

C polymucleotide consisting of a sequence encoding an amino a available in electronic form from the US patent office at ftp. seqdate.uspto.gov/sequence.html?DocID:2004034888. The poof of the invention are also useful in physical arrays of molect plant breeding markers. The recombinant DNA construct is use improving plant tolerance to cold, heat, drought, herbicides osmotic conditions, pathogens or pests, for manipulating green plant cells by modification of the cell cycle pathway. For a increased resistence to plant disease, for producing galactic lignin or plant growth regulators, for increasing the rate of computation in plants, for improving yield by modification photosynthesis or carbohydrate, nitrogen or phosphorus use or by providing improved plant growth and development under stress condition or for modifying seed oil or protein yield content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA consi
                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant DNA construct, useful for improving plant to cold, heat, drought, herbicides, extreme osmotic conditions pests, for conferring increased resistance to plant disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               <u> hieccercececedearcreaaccaccacarcreacacciecececarrie</u>

                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid arepresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ1754) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

```
detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Whole Genome Sequence Comparisons and 'Full-Length' cDNA Sequences:
A Combined Approach to Evaluate and Improve Arabidopsis Genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Direct Submission

Submitted (18-NOV-2003) Genoscope - Centre National de Sequencage :

BP 191 91006 ENTY cedex - FRANCE (E-mail : segref@genoscope.cns.fr
- Web : www.genoscope.cns.fr)

The sequences are based on single pass reads.

Life Technologies (a division of Invitrogen) members carried out full-length librairies construction : Temple G.

Genoscope members carried out sequencing and annotation : Castelli V., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachter V., Weissenbach J., Salanoubat M.

URGY INRA : Clept C., Caboche M.

Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences) : S prime and 3 prime are assembled with Phrap.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Arabidopsis thaliana Full-length cDNA Complete sequence from clone GSLTFB16ZA06 of Flowers and buds of strain col-0 of Arabidopsis thaliana (thale cress).

Genoscope.  Direct Submission  Submitted (18-NOV-2003) Genoscope - Centre National de Sequencage : BP 191 9100 GENEX cedex - FRANCE (B-mail : seqref@genoscope.cns.fr  - Web : www.genoscope.cns.fr)  The sequences are based on single pass reads. Life Technologies (a division of Invitrogen) members carried out full-length librairies construction : Temple G. Genoscope members carried out sequencing and annotation : Castelli V. Aury J.W. Jaillon O., Wincker P., Menard M., Cruaud C., URGV INRA : Clepet C., Cabbor, M. Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrap. http://www.genoscope.cns.fr/cgi-bin/ggb/ggb?source=Arabidopsis. Joint Submission

Loud Submission

Submitted (20-JUL-2004) Genoscope - Centre National

BP 191 91006 EVRY cedex - FRANCE (E-mail : seqref@ge-
Web : www.genoscope.cns.fr)

1st strand cDNA was primed with a NotI-oligo(dT) pri-
end enriched, double-strand cDNA was digested with N
into the Not I and EcoR V sites of the pCMVSPORT 6 v
was normalized. Library was constructed by Life Tech
division of Invitrogen.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                 1 MPSYADVDRQIEQLSECKPL.......BPAPRQSEPDVTRKTPDYFL 306
